Assignment 1

Pan Hao

Question 1

- i. $S = \{x \in \mathbb{R} | x = \sqrt{2} + k, k \in \mathbb{N} \}$
- **ii. Proof:** For any arbitrary $k \in \mathbb{N}$, we define $S_k := (\sqrt{2} + k, \sqrt{2} + k + 1)$. According to the definition, $S_k \subset \mathbb{R} \setminus S$. For arbitrary $x \in S_k$, let $\delta = min\{x \sqrt{2} k, \sqrt{2} + k + 1 x\}$, $\exists B(x, \delta)$ is an open ball, thus S_k is an open set. Then the complement of S in \mathbb{R} $\overline{S} = \bigcup_{k \in \mathbb{N}} S_k$ is an open set. Therefore, S is an closed set.
- **iii. Proof:** Since \mathbb{N} is unbounded (according to the Archimedes character), S is an unbounded set.
- iv. B((0,0,4),1)
- v. **Proof:** Obviously it is an open set since it is an open ball.
- **vi. Proof:** $\forall \vec{x_1}, \vec{x_2} \in B(0,0,4), d(\vec{x_i},(0,0,4)) < 1$. Therefore, according to triangular inequality, $d(\vec{x_1}, \vec{x_2}) \leq d(\vec{x_1},(0,0,4)) + d(\vec{x_2},(0,0,4)) < 2$. Thus, this open ball is bounded.
- **vii.** diam(B) = 2.

Proof: For arbitrary points $\vec{p}, \vec{q} \in B(\vec{x}, 1), d(\vec{x}, \vec{p}) < 1, d(\vec{x}, \vec{q}) < 1$, thus $d(\vec{x}, \vec{y}) < 2$

according to the triangular inequality. Now consider two point sequences:

$$A_k = \{(0,0,3+\frac{1}{2^k})|k \in \mathbb{N}\}, B_k = \{(0,0,5-\frac{1}{2^k})|k \in \mathbb{N}\}$$

Obviously $A_k, B_k \subset B(\vec{x}, 1)$. Then we can tell

$$\lim_{k\to\infty}d(A_k,B_k)=2$$

Which means $\forall \varepsilon > 0, \exists N > 0$, when $k > N, d(A_k, B_k) > 2 - \varepsilon$. Then we can tell $sup(\vec{p}, \vec{q}) = 2$, which means diam(B) = 2.

Question 2

i.

$$\lim_{(x,y)\to(3.5)} (\frac{\sin(y-x)}{y-x}, \sqrt{y^2-x^2})$$

exists

Proof: Both $\frac{\sin(y-x)}{y-x}$ and $\sqrt{y^2-x^2}$ are continuous at point (3,5), thus the limit is equal to $(\frac{\sin 2}{2},4)$.

ii.

$$\lim_{(x,y)\to(0,0)} \frac{x^4 - y^3}{x^3 - y^4}$$

doesn't exist.

Proof: Replace *y* with $kx(k \in \mathbb{R})$, then the original formula is equal to

$$\lim_{x \to 0} \frac{x^4 - k^3 x^3}{x^3 - k^4 x^4} = \lim_{x \to 0} \frac{x - k^3}{1 - k^4 x}$$
$$= -k^3$$

which is uncertain. Therefore, the limit doesn't exist.

iii.

$$\lim_{\substack{x \to +\infty \\ y \to +\infty}} \frac{x^3 - y^3}{x^4 - y^4}$$

exists.

Proof: The original formula is equal to

$$\lim_{\substack{x \to +\infty \\ y \to +\infty}} \frac{x^2 + xy + y^2}{x^3 + x^2y + xy^2 + y^3}$$

which is obviously no less than zero. Then

$$\lim_{\substack{x \to +\infty \\ y \to +\infty}} \frac{x^2 + xy + y^2}{x^3 + x^2y + xy^2 + y^3} = \lim_{\substack{x \to +\infty \\ y \to +\infty}} \frac{x^2 + xy + y^2 + \frac{y^3}{x} - \frac{y^3}{x}}{x^3 + x^2y + xy^2 + y^3}$$

$$= \lim_{\substack{x \to +\infty \\ y \to +\infty}} \left(\frac{1}{x} - \frac{y^3}{x^4 + x^3y + x^2y^2 + xy^3}\right)$$

$$\leq \lim_{x \to +\infty} \frac{1}{x} = 0$$

As a result,

$$0 \le \lim_{\substack{x \to +\infty \\ y \to +\infty}} \frac{x^3 - y^3}{x^4 - y^4} \le 0$$

Therefore, the limit is equal to 0.

iv.

$$\lim_{x \to +\infty} \lim_{y \to -\infty} \frac{x^3 - y^3}{x^4 - y^4}$$

exists.

Proof: Replace y with $u = \frac{1}{y}$, then

$$\lim_{y \to -\infty} \frac{x^3 - y^3}{x^4 - y^4} = \lim_{u \to 0^-} \frac{x^3 - \frac{1}{u^3}}{x^4 - \frac{1}{u^4}} = \lim_{u \to 0^-} \frac{(u^3 x^3 - 1)u}{u^4 x^4 - 1} = 0$$

Therefore,

$$\lim_{x \to +\infty} \lim_{y \to -\infty} \frac{x^3 - y^3}{x^4 - y^4} = \lim_{x \to +\infty} 0 = 0$$

v.

$$\lim_{(x,y)\to(e,0)} (1+2020y)^{\frac{1}{y-x^2y^2}}$$

exists.

Proof: Consider

$$f: \mathbb{R}^2 \to \mathbb{R}^2, f(x, y) = ((1 + 2020y)^{\frac{1}{2020y}}, \frac{2020y}{y - x^2y^2})$$

=

$$f: \mathbb{R}^2 \to \mathbb{R}^2, f(x, y) = ((1 + 2020y)^{\frac{1}{2020y}}, \frac{2020}{1 - x^2y})$$

, Therefore,

$$\lim_{(x,y)\to(e,0)} \mathbf{f}(x,y) = (e,2020)$$

$$\mathbf{g}: \mathbb{R}^2 \to \mathbb{R}: \mathbf{g}(u,v) = u^v$$

Then invoke the composition rule:

$$\lim_{(u,v)\to(e,2020)} \mathbf{g}(u,v) = e^{2020}$$

vi.

$$\lim_{(x,y)\to(3,+\infty)} \frac{\log(x+y)}{x^2+y^2}$$

exists.

Proof: According to the fundemental inequality, $x^2 + y^2 \ge \frac{x^2 + y^2}{2}$, then

$$\frac{\log(x+y)}{x^2+y^2} \le \frac{\log(x+y)}{\frac{(x+y)^2}{2}}$$

Replace $x^2 + y^2$ with u. When $(x^2 + y^2) \to (3, \infty), u \to \infty$. Then

$$\lim_{(x,y)\to(3,\infty)} \frac{\log(x+y)}{\frac{(x+y)^2}{2}} = \lim_{u\to\infty} \frac{2\log u}{u^2} = 0$$

Meanwhile, the original formula is no less than zero, which means

$$0 \le \lim_{(x,y)\to(3,+\infty)} \frac{\log(x+y)}{x^2 + y^2} \le 0$$

Therefore, the limit is equal to 0.

Question 3

i. **Proof:** Denote \vec{h} as $\begin{bmatrix} h_x \\ h_y \end{bmatrix}$, \vec{t} as $\begin{bmatrix} x \\ y \end{bmatrix}$. Take the linear function $\vec{L}(\vec{h})$ as $\begin{bmatrix} 2 & 0 \\ 0 & 2 \\ 2 & 1 \end{bmatrix} \begin{bmatrix} h_x \\ h_y \end{bmatrix}$.

Consider

$$\mathbf{f}(\vec{t} + \vec{h}) - \mathbf{f}(\vec{t}) - \mathbf{L}(\vec{h}) = \begin{bmatrix} 2(x+h_x) + 3 - (2x+3) - 2h_x \\ (x+h_x)^2 + (y+h_y)^2 - (x^2+y^2) - 2h_y \\ (y+h_y)e^{2(x+h_x)} - ye^{2x} - (2h_x+h_y) \end{bmatrix}$$
$$= \begin{bmatrix} 0 \\ h_x^2 + 2xh_x + 2h_y(y-1) + h_y^2 \\ ye^{2x}(e^{2h_x} - 1) + h_y(e^{2(x+h_x)} - 1) - 2h_x \end{bmatrix}$$

When $\vec{t} = (0, 1)$,

=

$$\mathbf{f}(\vec{t} + \vec{h}) - \mathbf{f}(\vec{t}) - \mathbf{L}(\vec{h}) = \begin{bmatrix} 0 \\ h_x^2 + 2xh_x + 2h_y(y-1) + h_y^2 \\ e^{2h_x} - 1 + h_y(e^{2h_x} - 1) - 2h_x \end{bmatrix}$$

$$\lim_{ec{h} o 0} rac{||oldsymbol{f}(ec{t} + ec{h}) - oldsymbol{f}(ec{t}) - oldsymbol{L}(ec{h})||}{||ec{h}||}$$

$$\lim_{\vec{h}\to 0} \sqrt{\frac{(h_x^2 + 2xh_x + 2h_y(y-1) + h_y^2)^2 + (e^{2h_x} - 1 + h_y(e^{2h_x} - 1) - 2h_x)^2}{h_x^2 + h_y^2}}$$

$$\lim_{\vec{h}\to 0} \sqrt{\frac{(h_x^2 + h_y^2)^2 + (2h_x h_y)^2}{h_x^2 + h_y^2}} (\vec{h} \to 0, 2h_x = e^{2h_x} - 1 + o(2h_x))$$

$$\lim_{\vec{h}\to 0} \sqrt{h_x^2 + h_y^2 + \frac{4}{\frac{1}{h_y^2} + \frac{1}{h_x^2}}} = 0$$

Therefore, f is differentiable at (0,1).

ii. At
$$(x,y) = (0,1)$$

$$\frac{\partial f_1}{\partial x} = 2, \frac{\partial f_1}{\partial y} = 0$$

$$\frac{\partial f_2}{\partial x} = 2x = 0, \frac{\partial f_2}{\partial y} = 2y = 2$$

$$\frac{\partial f_3}{\partial x} = 2ye^{2x} = 2, \frac{\partial f_2}{\partial y} = e^{2x} = 1$$

iii.

$$[\mathbf{d}\boldsymbol{f}|_{(0,1)}] = \begin{bmatrix} 2 & 0\\ 0 & 2\\ 2 & 1 \end{bmatrix}$$
